

Communication Modules for PCS 7, TIA and STEP 7 to SIEMENS Controllers

- Simple, rapid connection of the scales to SIMATIC controllers
- Complete communication modules for PCS 7, TIA and STEP 7
- The programmer can parameterize the existing modules at any time
- PCS 7 modules have faceplates to visualize the weighing data
- Compatible with PCS 7 release 7, 8 and 9
- The scales is portrayed in the system as a SIEMENS component (in Hardware configuration)
- Easy editing of statuses and commands for setpoints and measured values
- No complicated programming required for fieldbus communication
- All scales values are directly available as binary or numerical values

Faceplate: DISOMAT Tersus

Application

Many of the Schenck Process weighing electronic systems are coupled with SIEMENS controllers from the SIMATIC S7 series. This coupling is often implemented by the customer or on their behalf. PROFIBUS or PROFINET are used as a medium of communication. This often involves significant effort and furthermore the same solution is often re-implemented by different programmers.

With the aid of the communication modules the weighing electronics can be integrated into automation systems with little effort.

Structure

The use of PCS 7 modules, the TIA library or the STEP 7 library means that the customer or the supplier of the control system no longer needs to program the PROFIBUS/PROFINET connection to the weighing electronics themselves.

The communication details remain concealed from the PLC programmer. The programmer needs only to specify the data and parameters desired at the moment of configuration.

Both the PCS 7 modules and the TIA and STEP 7 libraries support all of the fieldbus-capable Schenck Process weighing electronics.

Function

PCS 7 modules

Each of the PCS 7 modules has a 'Faceplate' that shows the most important weighing data in a PCS 7 graphical display.

Furthermore, the module uses the WinCC detection system integrated into the PCS 7.

A module from the TIA or STEP 7 libraries should be used for implementation in a SCADA solution.

TIA library, STEP 7 library

Today, many installations are realized using SIEMENS SIMATIC S7 systems and programmed in TIA or STEP 7.

The STEP 7 library is a collection of routines for the SIMATIC S7-300 and 400 series that implement access from the control program via PROFIBUS/PROFINET to scales data or the transfer of commands and setpoints to the weighing electronics.

There is a corresponding module for the TIA portal for newer series S7-1200/1500 controllers. In this case communication ought to be carried out using PROFINET.

Expansions for editing statuses and commands and for setpoints and measured values can be easily implemented in a familiar programming environment.

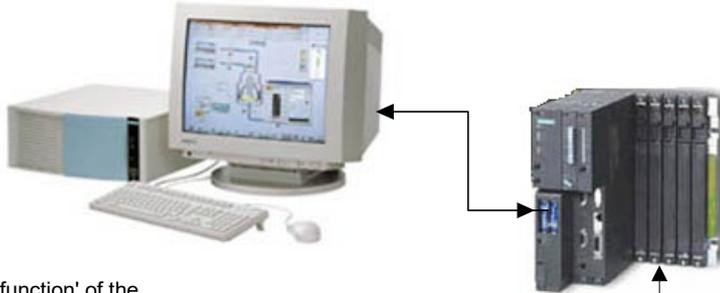

Main difference to the PCS 7 modules:

The STEP 7 library routines do not have faceplates or WinCC messages.

The graphical visualization of a module shows inputs (commands, setpoints, etc.) in the left-hand column and status bits and measured values in the right-hand column.

Example: SIEMENS PCS 7 system with DISOCONT Tersus

'Substitute function' of the PCS 7 module:
It conceals the subordinate communication.

The controller programmer can use directly the DISOCONT Tersus CFC in-/outputs..
